

Five-key wallet dominance catalog with leaks

A complete exact catalog allowing arbitrary leak probability and $1/2 < p_{\text{safe}} < 1$

How to read the catalog

A wallet is written by its minimal accepted sets. For example, $\langle 12, 134 \rangle$ accepts every key set containing 12 or 134. For each of the 131 isomorphism classes having at least two incomplete layers, the catalog gives a concrete wallet G having at most one incomplete layer.

Write $s=p_{\text{safe}}$, $t=p_{\text{theft}}$, $o=p_{\text{lost}}$, $e=p_{\text{leak}}$, and $d=s-t-o-e=2s-1$. Every displayed gap is the exact expansion

$$\Delta(\mathbf{d}, \mathbf{t}, \mathbf{o}, \mathbf{e}) = \Phi(\mathbf{G}) - \Phi(\mathbf{W}) \text{ after substituting } \mathbf{s} = \mathbf{d} + \mathbf{t} + \mathbf{o} + \mathbf{e}.$$

Every coefficient displayed is nonnegative. Each gap also contains a positive term on each pure t -, o -, and e -boundary. Since $d > 0$ and $t+o+e=1-s > 0$, every listed G strictly dominates W throughout $1/2 < s < 1$, with no assumption that $e=0$.

Enumeration summary: 7581 labeled monotone wallets; 210 classes up to key permutation; 131 classes with at least two incomplete layers; 131 strict exact certificates below.
